

KitchenLang IDE: Official User Manual

For ease of access, Access our **KitchenLang** by clicking this [link](#)

Welcome to the KitchenLang IDE! This integrated development environment allows you to write, visualize, compile, and simulate culinary recipes using a custom programming language.

1. Interface Overview

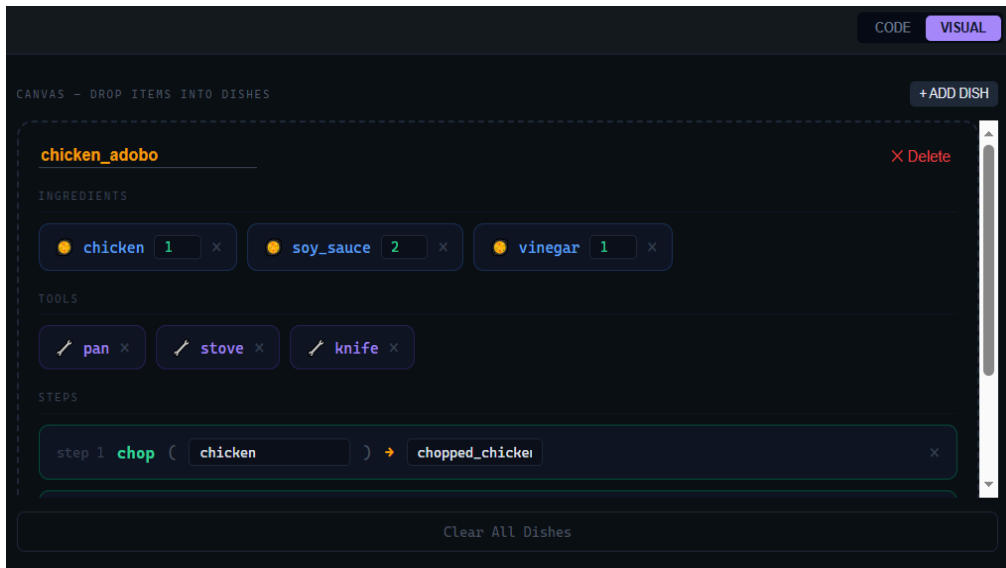

The IDE is divided into three main workspaces:

Left Pane (The Editor): Toggle between Code Mode (a text editor with live syntax highlighting) and Visual Mode (a drag-and-drop canvas). Both modes automatically sync with each other.

```
1  dish_def chicken_adobo {
2
3      recipe_mk {
4          ingredient_def chicken = 1, soy_sauce = 2, vinegar = 1;
5          tool_use pan, stove, knife;
6          step_do chop {
7              chopped_chicken = chicken;
8          }
9          step_do mix {
10             marinade = chopped_chicken + soy_sauce + vinegar;
11         }
12         step_do fry {
13             cooked_dish = marinade;
14         }
15     }
```

Code Mode

Visual Mode

Right Pane (The Compiler Pipeline):

Inspect how the compiler understands your code. Features tabs for Tokenization, the Abstract Syntax Tree (AST), Semantic Analysis, and CFG Derivations.

Tokens Parse Tree Semantic Derivation

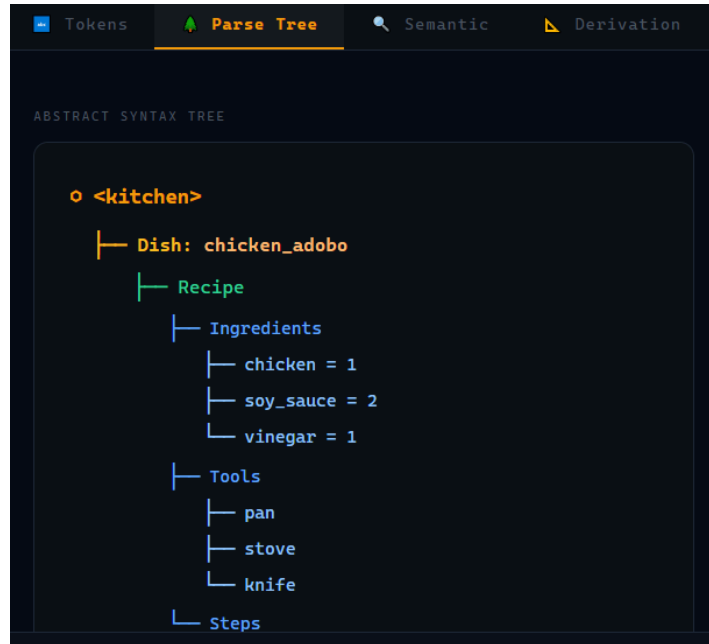

TOKEN STREAM - 58 tokens produced

KEYWORD (11) IDENTIFIER (16) NUMBER (3) OPERATOR (8)
SYMBOL (20) STRING (0) COMMENT (0) UNKNOWN (0)

TABLE VIEW

#	Type	Value	Line	Col
1	KEYWORD	dish_def	1	1
2	IDENTIFIER	chicken_adobo	1	10
3	SYMBOL	{	1	24
4	KEYWORD	recipe_mk	3	5
5	SYMBOL	{	3	15
6	KEYWORD	ingredient_def	5	9
7	IDENTIFIER	chicken	5	24
8	OPERATOR	=	5	32
9	NUMBER	1	5	34
10	SYMBOL	,	5	35

Tokens Tab

Parse Tree Tab

The screenshot shows the 'Semantic' tab in the same software interface. The title bar includes 'Tokens', 'Parse Tree', 'Semantic' (selected), and 'Derivation'. The main content area is titled 'SEMANTIC ANALYSIS REPORT'. It features a green box with a checkmark icon and the text 'All semantic checks passed!' followed by '1 warning • 3 steps analyzed'. Below this, there is a 'WARNINGS' section with a yellow box containing a warning icon and the text 'Technique 'mix' may require one of: bowl, spoon line 9'. At the bottom, there is a 'SEMANTIC RULES CHECKLIST' section with three items, each marked with a green checkmark: 'Ingredient Declaration' (All ingredients declared before use in steps), 'Tool Declaration Rule' (All tools must be declared with tool_use), and 'Step Dependency Rule' (Each substep must exist before being used).

SEMANTIC ANALYSIS REPORT

 **All semantic checks passed!**
1 warning • 3 steps analyzed

WARNINGS

 **Technique 'mix' may require one of: bowl, spoon line 9**

SEMANTIC RULES CHECKLIST

-  **Ingredient Declaration**
All ingredients declared before use in steps
-  **Tool Declaration Rule**
All tools must be declared with tool_use
-  **Step Dependency Rule**
Each substep must exist before being used

Semantic Tab

GRAMMAR DERIVATION - CFG Rules

CONTEXT-FREE GRAMMAR (CFG)

```

<kitchen> ::= <dish_def>+
<dish_def> ::= dish_def <id> { <recipe_mk> <serve_out> }
<recipe_mk> ::= recipe_mk { <ingredient_def> <tool_use> <stmt_list> }
<ingredient_def> ::= ingredient_def <ing_list> ;
<ing_item> ::= <identifier> = <number> | <identifier> = input ( <string> )
<tool_use> ::= tool_use <tool_list> ;
<stmt_list> ::= <stmt> | <stmt> <stmt_list>
<stmt> ::= <step_do> | <output_stmt>
<step_do> ::= step_do <technique> { <identifier> = <arg_list> ; }
<output_stmt> ::= output ( <string> | <identifier> ) ;
<serve_out> ::= serve_out <identifier> ;

```

STEP-BY-STEP DERIVATION FOR: step_do chop(...)

1 <kitchen> => <dish_def>+

⋮

2 <step_do> => step_do <technique> { <action_stmt> }

⋮

3 <action_stmt> => <identifier> = <arg_list> ;

⋮

4 <technique> => chop

⋮

5 <arg_list> => chicken

⋮

✓ Terminal String: step_do chop { chopped_chicken = chicken; }

DerivationTab

Bottom Pane (The Terminal and Execution Log): Watch the Virtual Machine execute your recipe step-by-step. If your code asks for user input, you will type it here.

TERMINAL
EXECUTION LOG

[Process completed]

Terminal

TERMINAL
EXECUTION LOG

WARNINGS

⚠ Technique 'mix' may require one of: bowl, spoon line 9

1 🍳 Starting dish: chicken_adobo

2 🍲 Loaded ingredient: chicken (qty: 1)

3 🍲 Loaded ingredient: soy_sauce (qty: 2)

Execution Log

2. Writing KitchenLang (Language Syntax)

Every KitchenLang script must follow a strict structural hierarchy.

BASIC STRUCTURE

```
dish_def dish_name {  
  recipe_mk {  
    ingredient_def ingredient1 = 1, ingredient2 = 2;  
    tool_use tool1, tool2;  
  
    step_do technique {  
      output_item = input_item1 + input_item2;  
    }  
  }  
  serve_out final_output;  
}
```

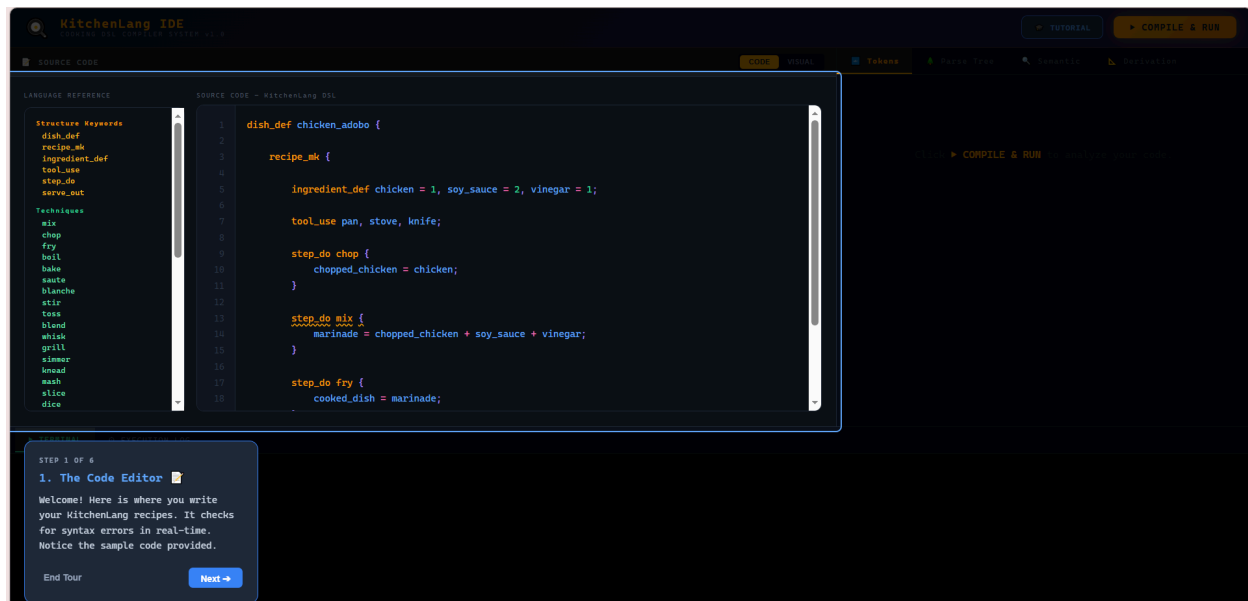

Keyword	Purpose	Example
dish_def	Defines the start of a new dish and its name.	dish_def pasta_salad {
recipe_mk	Opens the main recipe block.	recipe_mk {
ingredient_def	Declares raw ingredients and quantities.	ingredient_def salt = 1;
input()	Prompts the user for a dynamic quantity.	water = input("How much?");
tool_use	Declares tools required for the dish.	tool_use pot, pan;
step_do	Performs a culinary technique.	step_do boil {
output()	Prints a message or ingredient to the terminal.	output("Done!");

<code>serve_out</code>	Ends the dish and serves the final product.	<code>serve_out cooked_pasta;</code>
------------------------	---	--------------------------------------

3. Top Bar Actions

TUTORIAL

Launches an interactive, step-by-step spotlight tour of the IDE's features.

Tutorial Mode

FORMAT CODE

Reads your compiled AST and automatically reformats your messy text into perfectly indented, standardized code. *(Requires a successful compilation first).*

```
1 dish_def chicken_adobo {
2
3     recipe_
4     mk {
5
6         ingredient_def chi
7         cken = 1, soy_sauce = 2, vinegar = 1;
8
9         tool_use pan, stove, knife;
10
11        step_do chop {
12            chopped_chicken =
13            chicken;
14        }
15
16        step_do mix {
17            marinade = chopped_chicken + soy_sauce + vinegar;
18        }
19    }
```

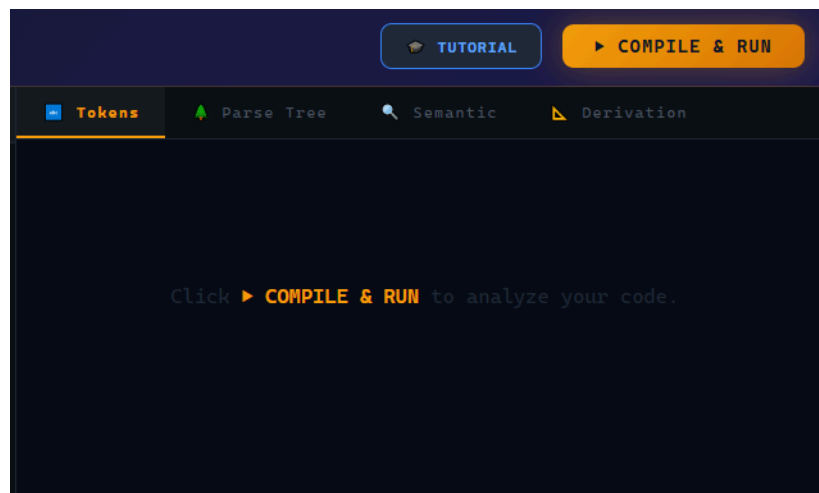

Original Code

```
1 dish_def chicken_adobo {
2
3     recipe_mk {
4
5         ingredient_def chicken = 1, soy_sauce = 2, vinegar = 1;
6
7         tool_use pan, stove, knife;
8
9         step_do chop {
10             chopped_chicken = chicken;
11         }
12
13         step_do mix {
14             marinade = chopped_chicken + soy_sauce + vinegar;
15         }
16
17         step_do fry {
18             cooked_dish = marinade;
19         }
20     }
```

Formatted Code

COMPILE & RUN

Processes your code through the Lexer, Parser, and Semantic Analyzer. If no errors are found, it triggers the Virtual Machine to execute your dish in the bottom terminal.

Compile & Run Button

If you prefer not to type, switch to Visual Mode.

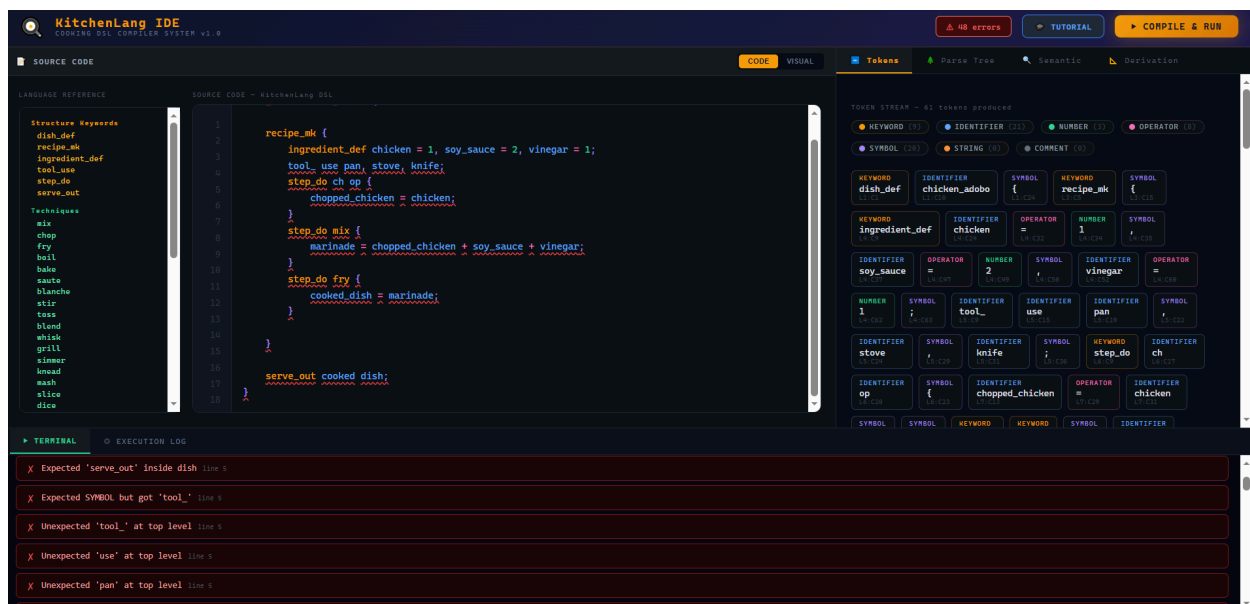

1. Click **+ ADD DISH** to create a new canvas.
2. Drag **Ingredients**, **Tools**, and **Techniques** from the left palette onto your dish canvas.
3. Fill in the input fields (quantities for ingredients, arguments for steps).
4. Switch back to **Code Mode**, and your visual layout will automatically generate perfect KitchenLang code!

5. Semantic Rules & Reminders

The compiler's Semantic Analyzer is strict. Keep these rules in mind to avoid errors:

- **Declaration Before Use:** You cannot use an ingredient in a `step_do` unless it was declared in `ingredient_def` or created as an output of a previous step.
- **Linear Consumption:** Ingredients are consumed when used! If you use `chopped_veg` in a `boil` step, you cannot use `chopped_veg` again in a later step. It has been transformed.
- **Tool Requirements:** Certain techniques require specific tools. If you use `step_do blend`, you *must* have declared `tool_use blender`; . If you forget, the compiler will issue a **Warning**.
- **Serve Output:** The variable you pass to `serve_out` must actually exist (either as a raw ingredient or the result of a step).
- **Comments:** Use `#` to write comments in your code. Note that the **Format Code** button strips comments because it regenerates code from the raw Syntax Tree.

Sample

6. Execution Logging

After clicking Compile & Run, open the **Terminal** tab to see your raw outputs and prompts. Switch to the **Execution Log** tab to see a beautiful, emoji-rich timeline of your recipe being prepared!

```

  x TERMINAL  @ EXECUTION LOG
  x ✓ tools ready: pan, stove, knife
  x
  x \ Step: chop(chicken) + chopped_chicken
    chicken(raw) + chopped_chicken [chopped]
  x
  x \ Step: mix(chopped_chicken, soy_sauce, vinegar) + marinade
    chopped_chicken[chopped] + soy_sauce(raw) + vinegar(raw) + marinade [mixed]
  x
  x \ Step: fry(marinade) + cooked_dish
    marinade[mixed] + cooked_dish [fried]
  x
  x ✓ SERVE: cooked_dish [fried]

```

Execution Log
